CCO/hutti/Pexels Selecting the right heat pump for your home means that you can save energy and reduce the cost of heating or cooling your home. In moderate climates, heat pumps are good alternatives to air conditioners or furnaces due to their energy efficiency. They're efficient because they move energy rather than generating it.With some research and brand comparison, you can find the heat pump that works for both your residence and for your budget. A heating and cooling professional can also help you determine the right size and type for your climate and home. Some of the leading heat pump brands are Carrier, Goodman, Air Source, Coleman and Bryant.How Heat Pumps WorkA heat pump is an all-in-one heating and air conditioning system, so it is effective year-round in locations where the climate is not extreme. It works by moving heat from a warm space into a cool space or by moving cool air into a warm space. In colder weather, the unit extracts heat from outdoors into your cool home. In warmer weather, the process is reversed and the unit collects hot air from your warm home and moves it outside.In general, heat pumps are most effective in warmer climates, when you want mostly cool air, with occasional need for warmer air. If you live in a climate where the temperature gets down to 10-25 degrees Fahrenheit, the heat pump won't work efficiently and you'll need some form of heat supplement, such as a gas furnace.There are three types of heat pumps: air source, split ductless and geothermal. Each varies in its efficiency, but the U.S. Department of Energy estimates that heat pumps reduce energy use by 30 to 60 percent.For the first two types of heat pumps, cooling efficiency is measured by SEER (Seasonal Energy Efficiency Ratio) and warming efficiency is measured in HSPF (Heating Seasonal Performance Factor). The American Council for an Energy-Efficient Economy recommends purchasing heat pumps that are at least 15 SEER and 8.5 HSPF. The most efficient Energy Star-rated heat pumps are 18 to 27.5 SEER and 8.5 to 12.5 HSPF.Geothermal heat pump cooling efficiency is rated via EER (Energy Efficiency Ratio), with heating efficiency measured in COP (Coefficient of Performance). Federal EER minimums range from 17.1 to 21.1 and COP minimums are 3.1 to 4.1.Costs of Installing Heat PumpsSystems that have the highest ratings cost the most, and all systems vary depending on the size of your home and other factors. Consumer Reports estimates the cost of installing a geothermal system in a 2,500 square-foot home at \$20,000 to \$25,000. This is several times the repair or installation cost of other heat pump systems, which homeadvisor.com places at \$3,997 to \$6,879. However, you may qualify for federal or other tax credits once you install a system.Reputable Heat Pump BrandsMost heat pump suppliers cannot give cost estimates until you provide them with specifics about your home environment.
